Commodity Monthly Monitor

G-20 sets tone for further upside

22 Oct - 23 Nov 2018

Summary

Commodity prices decidedly fell last month. The commodity rally from 21 Sept to 22 Oct 2018 was short-lived. The short-covering that was driving the rally in precious metals and softs in during that period (21 Sept to 22 Oct 2018) fizzled out. Meanwhile oil prices tumbled in an eerily similar fashion to 2014.

However, as this document goes out to print, commodities are rallying. The upside corrections come after the G-20 summit that concluded this past weekend. The US softened its stance on trade with China, offering a 90-day truce on higher tariffs that were supposed to come into effect on US\$200bn of imports into the US. China also said it will reduce tariffs on US cars and will commit to importing an undisclosed amount of US agriculture, industrial and energy products. Russia and Saudi Arabia agreed to continue their cooperation on managing oil supply through 2019, which we believe will be a precursor to the Organization for the Petroleum Producing Countries (OPEC) coming together to cut supply at its meeting later this week. Qatar's exit from the OPEC group in January (announced this past weekend) is likely to have little impact if Saudi Arabia (largest OPEC member) and Russia (largest OPEC partner) push for supply cuts. The Canadian province of Alberta has also announced it will cut oil production in an unorthodox move for a non-OPEC associated country, which will also counter any negative effects of Qatar's exit.

While the US Dollar has appreciated most of the past month, the currency began to depreciate in response to a somewhat dovish tone from the Federal Reserve Chairman, Jerome Powell. Likewise, US Treasuries were yielding more than 3.2% earlier in the month but are now down to 3.0% (as on 29 Nov 2018). So, factors that appeared to have a negative weight on gold are now easing. Indeed, if Powell is bowing to criticism from President Trump, we could see the central bank allow the economy to run a little hot and generate upside surprises in inflation. That is likely to benefit gold prices. There are a plethora of risks that seemed to be ignored by gold futures markets and we believe that an upside correction is due. A key event in the European calendar is the Parliamentary vote on the Brexit proposal on December 11th. Investors should recall when the UK first voted to leave the EU, speculative positioning in gold futures hit an all-time high.

- Raised uncertainty across agricultural commodities ahead of the G-20 summit. As we approached the
 G-20 summit, net speculative positioning across agricultural commodities (except for wheat and
 coffee) turned bearish owing to rising uncertainty around trade negotiations between US and China.
 The sharp slump in crude oil prices have also dampened sentiment across key agricultural commodities
 used in ethanol production such as corn and sugar.
- Tighter fundamentals to support industrial metals higher. While industrial metals came under pressure
 last month due to the ongoing trade wars, we believe prices are ripe for a correction as stronger
 fundamentals are likely to eventually dominate investor sentiment.
- Natural gas and oil diverged significantly last month. Natural gas gained 34% while oil fell more than 23%. We believe both are likely to be transitory. Natural gas rose only because of a cold snap in the US. That will pass. Oil fell as US inventories have risen 9%. We believe OPEC will act later this week to stem production and hence the price slide.
- The short-covering rally in gold and silver has ended prematurely and shorts are being built up again.
 That remains baffling given the plethora of risks that should be supporting the two defensive assets. We believe that a covering rally will resume as the futures market acknowledges the risks that ETP investors and centrals banks have been expressing through their purchases.

Sector Overview

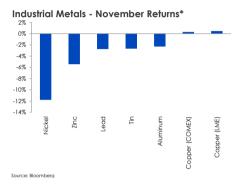

- Upward revisions to Chinese corn stocks over the past 10 years was the highlight of the United States Department of Agriculture (USDA) November World Agricultural Supply and Demand Estimate (WASDE) report. According to revised figures from the National Bureau of Statistics, Chinese corn supplies have been underreported by 149mn tons since 2007. The 2017 corn crop is now quoted at 259mn tons, 20% higher than the previous figure. As a result, USDA increased its projected 2018/19 Chinese corn ending stocks to 207mn, with the global corn stocks in 2018/19 nearly doubling versus its previous October estimate to 307mn tons. USDA's assessment situation of corn supply outside of China remains unchanged. China is now less likely to become an importer of corn over the next year unless demand increases significantly.
- The short covering rally in coffee and sugar futures lost momentum last month as prices declined 11.5% and 9.7% respectively. The sharp decline in crude oil prices over the prior month weighed on sugar prices as less sugarcane would be needed to produce ethanol. On the contrary, we expect oil prices to recover from current levels and ethanol to remain a competitive alternative source of energy. In addition, the outlook on the sugar market has improved considerably evident from the latest estimates from USDA and the International Sugar Organisation (ISO). Both agencies have lowered their forecasts of sugar production in 2018/19. India, Thailand and the EU are likely to produce less sugar.

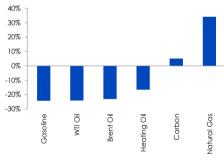

Industrial Metals

- Copper was the only exception in the industrial metals complex to end the period with a positive performance. The International Copper Study Group (ICSG) confirmed an unexpectedly higher deficit on the global copper market to the tune of 259,000 tons in the first 8 months of this year, owing to higher demand from China. In addition, concerns about supply disruptions owing to strikes and maintenance work- at the Spence copper mine in Chile, Codelco in Chile and Tuticorin copper smelter in India, is lending buoyancy to copper prices.
- Nickel prices declined below US\$11,000 per ton for the first time since December 2017. Concerns that more supply will be available next year are being reflected in the price decline. In addition, macro trade fears have risen, and electric vehicle exuberance has subsided. Following a 2-year environmental audit period for Philippines mines, the Department of Environment and Natural Resources confirmed that nine of the twelve mines that were shut over a year ago will be allowed to resume operations provided they resolve their shortcomings. If the mines in the world's second largest nickel producer, do re-open, it would allow the supply situation for nickel to stabilise. While International Nickel Study Group (INSG) has raised the prospect of an 8.4% production growth next year, the nickel market will continue to show a supply deficit of 33,000 tons next year. We remain of the view that investors are discounting the incremental demand opportunity from battery technology used in electric vehicles. We also believe the sharp decline in availability of nickel stocks should lend a failwind to prices.

- Last month we saw the worst decline in oil prices since 2014. However, the events over the pass weekend should plant the seeds for the Organization for the Petroleum Producing Countries (OPEC) to collaborate with their external partners to cut production at their meeting later this week. The G-20 meeting over the weekend provided fertile ground for fire-side discussion among policy makers from topics ranging from international trade (US President Trump and Chinese President Xi) to oil market policies (Saudi Arabian Energy Minister, Khalid A. Al-Falih and Russian Energy Minister, Alexander Novak). In the past meeting between Al-Falih and Novak have foreshadowed deals within OPEC and as we argued in our recent blog post OPEC: Déjà vu - No thank you! it is in both countries' interest to
- A continued glut in US oil, underscored by inventories surprising to the upside in every week in the past month, has led to the WTI benchmark widening against the Brent benchmark. At over an \$8 spread we are a long way from the \$4 average spread we became accustomed to in July 2018. We expect international crude markets to remain tighter than the US until the US builds out the necessary infrastructure to export at higher volumes. Until we se the infrastructure, we expect Brent to continue to trade at a premium to WTI.
- Natural gas was the star performer in the commodity space in the past month, rallying 34% following a cold snap in the US. Approximately half of US natural gas is used for heating purposes. Inventories for the commodity are more than 1 standard deviation below the 5-year average, highlighting the tightness in the market.

The short-covering rally that assisted gold prices in the prior month fizzled out and gold shorts are being re-built. Gold's failure to acknowledge a plethora of risks is baffling. Over the period that our data covered, there was very little certainty about the events that would take place over the past weekend at the G-20 meeting, Saudi Arabia's Crown Prince risked becoming ostracized by the international community, sanctions were re-imposed on Iran (which could have led to a retaliation by the nuclear nation), Russia exerted aggression towards Ukraine, Italy insisted on sticking to its budget that has been rejected by the European Commission. Gold futures market speculative positioning and price seem to have ignored all of these risks. A key event in the European calendar is the Parliamentary vote on the Brexit proposal on December 11th. Investors should recall when the UK first voted to leave the EU, speculative positioning in gold futures hit an all-time high. Central banks and exchange traded product (ETP) investors on the other hand have been buying gold. In October there were close to US\$100mn (16.6 tonnes) of inflows into gold ETPs according to World Gold Council data. The central banks of Hungary and Russia added substantially to their gold reserves in the month of October. We believe it is only a matter of time before the futures market sees what others are expressing through their purchases. Another short-covering rally could drive gold prices higher.

With European car sales having been front-loaded in the summer as consumers tried to avoid the introduction of new emission tests, we expect car sales to remain slow, potentially dampening demand

for the platinum group metals. *Note: all returns are based on front month futures prices in the month to Friday 23 November 2018.

Historical performance is not an indication of future performance and any investments may go down in value.

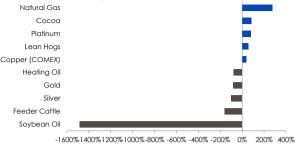

Technical Overview (as of Nov 23, 2018)

Positionina

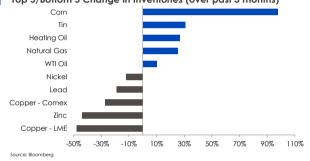

- Net speculative positioning in cocoa increased 85.8% as short positions in cocoa were trimmed by 29% over the prior month. Despite all the concerns of higher supply from two of the world's largest producers in Ivory coast and Ghana, investors turned less bearish on the outlook for cocoa.
- Soybean oil saw the largest bearish positioning move. Net short positioning rose to 35,789 contracts over the prior month, more than 1-standard deviation below its 5year average. Rising uncertainty ahead of the G-20 summit coupled with the slump in crude oil prices weighed on sentiment. Not only has USDA lowered its forecast for Chinese soybean imports in 2018/19, it has raised its estimate of global oilseed stocks by 2.4mn tons mainly on higher stocks of soybeans.
- Speculative positioning in natural gas futures rose as the cold weather snap enticed investors to the asset. That's the first-time positioning has been net long in since May 2017. With inventories remaining more than 1 standard deviation below the 5-year average, the supply of gas remains tight. However, as the cold snap passes, we expect positioning will head back to net short.
- The short-covering rally in gold and silver proved to be transitory. Both gold and silver futures markets are back to net short again. The futures market is contradicting the ETP market, where there have positive inflows into long gold products.

Top 5/Bottom 5 Change in CFTC Net Positions (over past month)¹

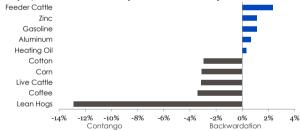

- Corn inventories have shown the most pronounced increase, up 97.8% over the past 3 months. This was largely due to the significant upward revision of Chinese corn crops over the last ten years reported by the National Bureau of Statistics. In accordance with the new figures from China, USDA increased its projected 2018/19 Chinese corn ending stocks to 207mn, with the global corn stocks in 2018/19 nearly doubling versus its previous October estimate to 307mn tons.
- The trend of declining inventory levels remains in place across most of the industrial metals. Only tin inventory levels rose over the past month. Backwardation in the London Metals Exchange (LME) copper curve continues to drive an inventory drawdown to a greater extent than COMEX copper which is now in contango.
- Natural gas inventories rose by 9.4%, due to seasonal injections, but that still left inventories at more than 1 standard deviation below the 5-year average. Supplies are tight and are likely have gotten tighter after the cold snap.

Top 5/Bottom 5 Change in Inventories (over past 3 months)²

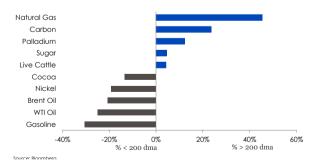

- All agricultural commodities, except for feeder cattle are in contango. Negative roll yields run as high as 3.4% for coffee and 3.1% for corn.
- The front end of the zinc futures curve is now in steep backwardation with a roll yield of 1.1% signifying tight supply. The deficit on the zinc market was revised significantly upwards last month by the International Lead and Zinc Study Group (ILZSG) and a renewed deficit is expected next year which should keep prices higher.
- Gasoline is the only energy commodity currently sporting front month backwardation (with a positive roll yield of 1.1%). That is in line with seasonal trends. As the season has progresses, we are likely to go back to contango markets by next month. The backwardation in Brent and WTI oil gave way to contango over a month ago and now provide more than a 0.3% roll yield drag. While front month natural gas is in contango, between month 3 and month 5 there is very steep backwardation owing to the sudden price surge in near month contracts.

Top 5/Bottom 5 Roll Yields (front to next month)3

- Sugar is trading 4.5% above its 200-daily moving average (dma), we expect prices to recover as supply on the global sugar market is expected to tighten next year.
- Cocoa prices are trading 13.3% below their 200-dma. While short positions in cocoa futures have been unwound over the past month, cocoa prices are likely to remain under pressure owing to higher supply from the world's largest cocoa producers.
- Nickel is trading 19.1% below its 200-dma. Sentiment has turned bearish over fears of higher supply from the Philippines. We believe investors are discounting the impact of higher demand from battery technology used in electric vehicles and prices
- The energy sector dominated both the top and bottom of the chart to our right. At the top, natural gas and carbon are trading 45% and 24% above their respective 200 day moving averages. The surge in natural gas prices was due to weather and likely to be transitory. At the bottom of the chart are gasoline, Brent and WTI oil trading 31%, 25%, 21% below their respective 200 day moving averages
- Although palladium prices pared back last month, they are still trading 12% above its 200 day-moving average and 3% above its 50 day-moving average.

Top 5/Bottom 5 Price Diff to 200 day moving av. (dma)⁴

CFIC futures net positioning as at report date, percent change from previous month. ² Percent change in inventory based on 3 month change (in %) Roll yields calculated as percent change between front month futures price and next month futures price on Nov 23, 2018.

Percent difference between the front month futures price and its 200 day moving average on Nov 23, 2018.

1Performance of front month futures from 23 Nov 17 (1 Year), 23 May 18 (6 Month), 23 Aug 18 (3 Month) and 23 Oct 18 (1 Month) to 23 Nov 18.
2Roll return non-annualised from front month futures into second "month on 23 Aug 18 (3 Month), 23 Oct 18 (1 Month), 16 Nov 18 (1 Week), 23 Nov 18.

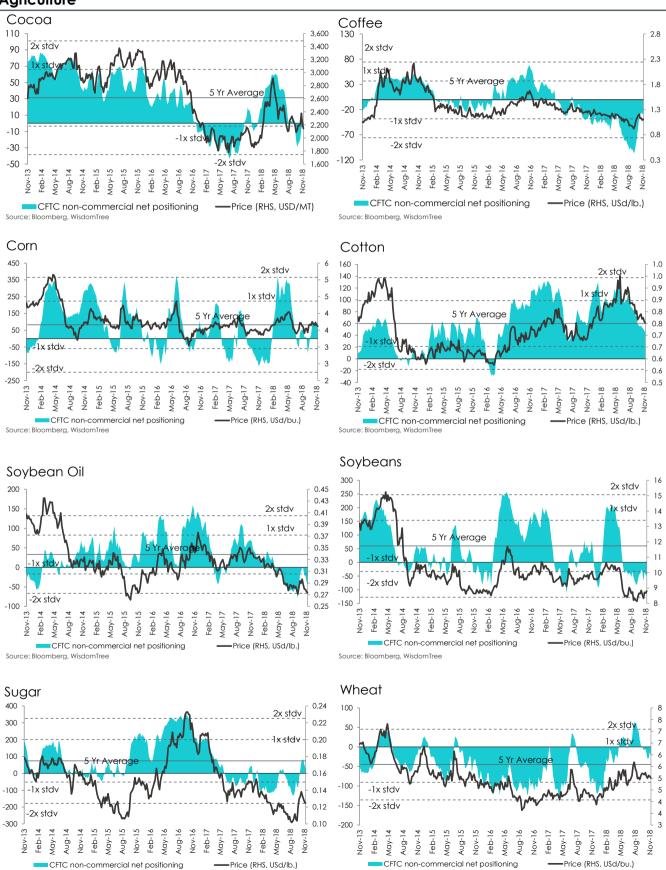

³Net positions in number of contracts. ⁴Current inventories relative to 1, 3, 6 months ago. Under the column "5 yr average" is the current inventory level relative to 5 year average inventory. For energy, 5 yr average is the average of the same month as report month over the past 5 years. SHFE started reporting inventory data from April 2015. SAll Industrial metals positioning data (excluding copper) is sourced from LME COTR data in Bloomberg from 30 January 2018 (first available date) under post-MIFID rules. **Brent 5 Yr average of net positions from January 2011 as positions were not reported by CFTC before then and inventory data (OECD) reported with 3 month lag with current = Aug 2018.

Historical performance is not an indication of future performance and any investments may go down in value.

Commodity Monthly Matrix Explained

Score based on unweighted sum of four fundamental/technical measures detailed below with each measure awarded a possible score of -1, 0, or 1 depending on whether variable is viewed as fundamentally negative, neutral or positive. Score ranging from -4 to +4. For commodities where data is not available or not relevant, scores are calculated on remaining variables and adjusted to the -4 to +4 scale. The score matrix is designed to highlight significant changes in key variables but should not be viewed as predictor of performance.

The four fundamental/technical measures are as follow:

- price vs. 200 days moving average: 1 when price is above 200dma and return is positive, -1 when price is below 200dma and return is negative, 0 otherwise
- % change in net positioning over the past month: 1 when % change is positive, -1 when % change is negative, 0 when no change
- % change in inventory level over the past 3 months: 1 when % is negative, -1 when % is positive, 0 when no change
- roll yield between the front and second month futures contracts: 1 when in backwardation, -1 when in contango, 0 when no change
